

Week 4 – Task 2

Please note: This activity is for individual students, and the submission deadline is Sunday, 17th May 2026 at 23.59.

Consider the following UML representation of the aggregation relationship between Class Account and Class Customer.

Required:

- (a) Write a java program that implements classes Account and Customer represented in the above UML class diagram.
- (b) Write a driver program to test the aggregation relationship illustrated in the given UML class diagram. The driver program shall perform at least the following functionalities:
 1. Prompt the user to enter the customer's full name and age.
 2. Use a loop to allow the user to create a customer account using the following menu:
 - Select 1 to create a customer account without an initial amount.
 - Select 2 to create a customer account with an initial amount.
 - Select 0 to exit the program.
 3. Based on the selected option (1 or 2), the program shall create the customer account and proceed to Step 4.
 - If the user selects 0, the program shall terminate.
 - For any invalid option, the program shall display an error message and return to Step 2.

4. Use another loop to provide the following account operations:
 - Select **1** to check account balance.
 - Select **2** to deposit money.
 - Select **3** to withdraw money.
 - Select **0** to exit.
5. When the user selects **1**, the program shall display the current account balance and then return to Step 4.
6. When the user selects **2**, the program shall prompt the user to enter the amount to be deposited, update the account balance accordingly, display a confirmation message indicating that the transaction was completed successfully, and then return to Step 4.
7. When the user selects **3**, the program shall prompt the user to enter the amount to be withdrawn, update the account balance accordingly, display a confirmation message indicating that the transaction was completed successfully, and then return to Step 4.
8. When the user selects **0**, the program shall terminate.

Submission:

1. Run the program and screenshot all the interactions from your program console to show all user inputs and outputs. Save the screenshot in the PDF file. Use your name and registration number as your PDF file name.
2. Zip your project folder and save it using your name and registration number.
3. Submit your zipped file and PDF file through the e-learning system.
